About and method

Data, definitions and limits.

Purpose

This report answers three commercial questions for a B2B data product: which accounts are likely to churn, which are ready to expand, and where paid capacity goes unused. Each page ends in a list a Sales, Customer Success or Marketing team can act on.

Data

- 1,000 accounts, monthly, March to August 2026: active seats, API calls and credits consumed.
- **All data is simulated for portfolio purposes.** Region, industry, tier, licensed seats, credit allowances and prices are generated by scripts/data_enhancement.py, sized to each account's observed usage so seats and credits stay consistent.
- Annual contract value is illustrative: licensed seats × an assumed list price (\$45, \$60 and \$80 per seat per month for Enterprise, Premium and Standard) × 12.

How accounts are classified

Rules are applied in this order for the selected month.

- Churn risk - API calls down 30% or more compared with the prior month
- Expansion opportunity - API calls up 25% or more over three months, and either 80% or more of seats in use or 90% or more of the credit allowance consumed
- Low adoption - Fewer than 50% of licensed seats in use
- Healthy - Everything else

Churn risk prioritization model

A logistic regression model ranks the accounts already on the Churn Radar by how likely they are to keep declining next month, so outreach can be ordered. It is trained on a time-based split (earlier months only) and backtested on a later month it never saw. Tested directly, it did not catch any account before a visible drop already existed, so it re-ranks an existing list rather than predicting silent churn, and it is described that way throughout.

Limits to keep in mind

- The data has no renewal dates or real churn outcomes, so "churn risk" is a usage-based warning sign, not a forecast.
- Six months of history is too short to separate seasonality from trend. Status needs three months of history, so the month filter starts in June.
- Estimated expansion ARR assumes a 25% seat uplift. It sizes the opportunity and is not a prediction.
